Project: Script-Controlled ACL District Record Access in ServiceNow

S.No	Parameter	Description
1	Problem Statement (Problem to be solved)	District users may access records belonging to other districts. A secure mechanism is required to enforce district-level restrictions, protect sensitive information, and ensure compliance
2	Idea / Solution Description	ServiceNow Access Control Lists (ACLs) with server-side scripting validate user roles and district ownership before granting access. Unauthorized requests are denied and logged.
3	Novelty / Uniqueness	The solution combines role-based access control with district-level record verification, providing fine-grained security and dynamic access validation.
4	Social Impact / Customer Satisfaction	Improves transparency, privacy, accountability, and trust. Users gain secure access while organizations strengthen governance and compliance.
5	Business Model (Revenue Model)	Can be offered as a ServiceNow security enhancement through implementation services, customization, training, maintenance contracts, and consulting.
6	Scalability of the Solution	The framework can be extended to additional districts, departments, regions, and future enhancements such as MFA, AI monitoring, and advanced auditing.

Solution Summary: The proposed ServiceNow ACL framework ensures that users can only access records belonging to their assigned district. The solution improves security, auditing, compliance, and operational efficiency while remaining scalable for future organizational growth.
