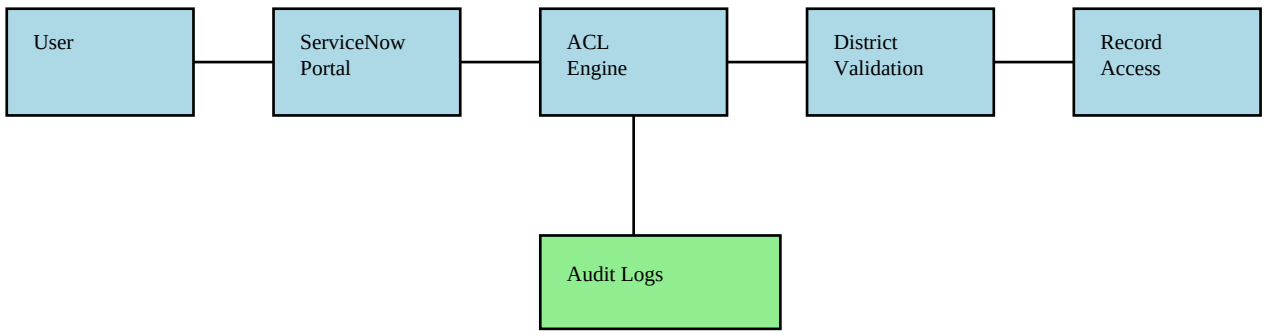
Solution Architecture

Project: Script-Controlled ACL District Record Access in ServiceNow

The solution architecture bridges the gap between business requirements and technical implementation. This architecture ensures that district records are protected through ServiceNow Access Control Lists (ACLs), role validation, district verification, and audit logging mechanisms.

Solution Architecture Diagram



Architecture Components

1. User Authentication: Validates user identity.
2. ServiceNow Portal: Provides access to district records.
3. ACL Engine: Executes access-control scripts.
4. District Validation: Confirms the user's district matches the record.
5. Record Access Layer: Grants or denies access.
6. Audit Logging: Stores access history for compliance and monitoring.

Data Flow

User → Login → Role Verification → ACL Script Execution → District Match Check → Access Granted/Denied → Audit Log Generation. This workflow ensures only authorized users can access district-specific information while maintaining accountability and compliance.
