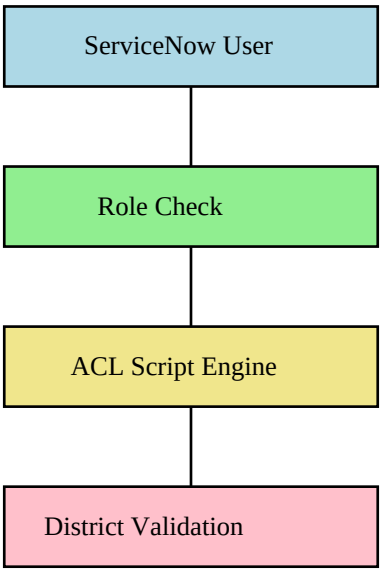
Script-Controlled ACL District Record Access in ServiceNow

This project implements district-based record security in ServiceNow using Script-Controlled Access Control Lists (ACLs). The solution ensures that users can access only records belonging to their authorized district. The technology stack combines ServiceNow platform capabilities, role-based security, ACL scripting, and district-level validation mechanisms to provide a secure, scalable, and maintainable access-control solution.

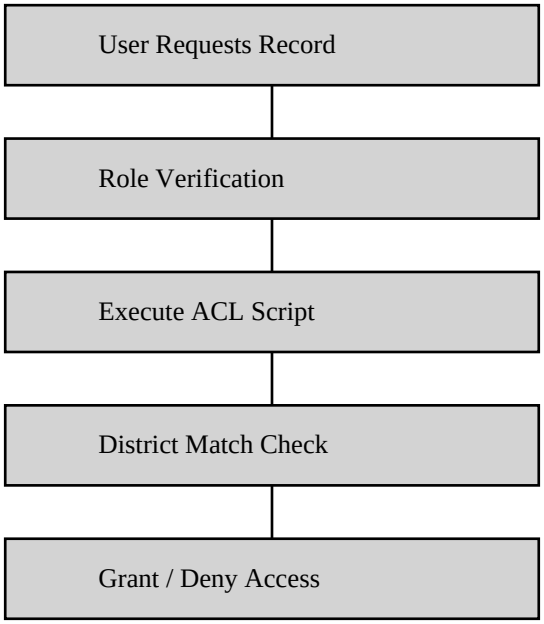
Technology	Purpose
ServiceNow Platform	Application Development & Administration
ACL (Access Control List)	Record and Field Security
JavaScript	ACL Scripting and Validation
User Roles	Permission Management
District Mapping	District-Based Access Control

System Architecture



Architecture Flow: Users access district records through the ServiceNow interface. The system first validates user roles, then executes ACL scripts. The ACL script compares the user's district assignment with the district stored in the requested record. Access is granted only when the validation succeeds.

Workflow Diagram



Workflow Explanation: 1. User requests a district record. 2. ServiceNow verifies assigned roles. 3. ACL scripts execute security logic. 4. District values are compared. 5. Access is granted or denied based on validation results. This workflow prevents unauthorized users from viewing, modifying, or deleting records belonging to other districts.

Detailed Technology Description

ServiceNow Platform: Provides table management, workflows, scripting, user administration, reporting, and security features. It acts as the foundation of the project. Access Control Lists (ACLs): ACLs enforce security policies for Read, Create, Write, and Delete operations. They ensure that only authorized users can interact with records. JavaScript: Used within ACL scripts to implement district-level validation logic and automate access decisions. User Roles: Roles simplify permission management by grouping access rights. Different roles can be assigned to district officers, supervisors, and administrators. District-Based Access Control: The core concept of the project. Each record belongs to a district, and ACL scripts ensure that only users assigned to the same district can access that record. Advantages: • Improved security and privacy • Reduced manual administration • Better compliance and auditing • Accurate district-level authorization • Scalable solution for large organizations
